Penggunaan begin commit rollback

begin commit rollback lebih sering digunakan untuk menyimpan data yang terjadi secara berulang-ulang, misalnya menyimpan data ke beberapa tabel sekaligus dengan menggunakan satu button.

```
Imports System.Data.SqlClient
```

```
Public Class Penjualan
```

```
Dim Trans As SqlTransaction
```

```
Private Sub Button1_Click(ByVal sender As System.Object, ByVal  
e As System.EventArgs) Handles Button1.Click
```

```
Trans = CONN.BeginTransaction (CONN sudah dibuat di module)
```

```
Try
```

```
Call Koneksi()
```

```
Dim simpan1 As String = "insert into nama_tabel values ('" &  
Label2.Text & "','" & Label4.Text & "')
```

```
CMD = New SqlCommand(simpan1, CONN)
```

```
CMD.ExecuteNonQuery()
```

```
Call Koneksi()
```

```
CMD = New SqlCommand("select * from tblbarang where  
kode_barang='" & DGV.Rows(baris).Cells(0).Value & "'", CONN)
```

```
DR = CMD.ExecuteReader
```

```
DR.Read()
```

```
If DR.HasRows Then
```

```
Call Koneksi()
```

```
Dim kurangistok As String = "update tblbarang set  
stok='" & DR.Item("stok") - DGV.Rows(baris).Cells(3).Value &  
"' where kode_barang='" & DGV.Rows(baris).Cells(0).Value & "'"
```

```
CMD = New SqlCommand(kurangistok, CONN)
```

```
CMD.ExecuteNonQuery()
```

```
End If
```

```
Next
```

```
Trans.Commit()
```

```
Catch ex As Exception
```

```
Trans.Rollback()
```

```
End Try
```

```
End sub
```

```
End Class
```
